## SUMMARY

Systems Engineering student in my 8th semester at Universidad de San Buenaventura in Bogotá. I'm interested in artificial intelligence, automation and security, and I like to understand how a system works inside before improving it. I pick up new tools quickly when a problem calls for them, and I take the time to document my work so others can build on it. I communicate clearly with both technical and non-technical people, stay calm when something breaks, and work well in teams, bringing order and ownership to my part.

## TECHNICAL SKILLS

**AI & automation:** LLM APIs (Groq, OpenAI-compatible), function calling, prompt engineering, n8n, REST API and webhook integration
**Languages:** Python, Java, JavaScript, SQL, C#, HTML/CSS
**Backend & data:** REST APIs (Java Servlets, FastAPI, Express), MySQL, PostgreSQL, data modeling, ETL, MapReduce, Pandas, Power BI
**Cloud & tools:** Azure, Docker, Git/GitHub, Linux, Scrum
**Security:** OWASP Top 10, authentication (PBKDF2, bcrypt, TOTP 2FA), role-based access control, log analysis

## EXPERIENCE

**IT Help Desk Agent — L1/L2 Technical Support (night shift)** Jan 2024 – Mar 2026
*TSP – Technology Solution Provider · Bogotá, Colombia*

- Handled and resolved 10–20 L1/L2 incidents and service requests per day in GLPI, documenting each case for full traceability under ITSM practices.
- Monitored 30,000+ infrastructure sensors and devices across multiple corporate clients with PRTG Network Monitor during the night shift, escalating availability alerts before they affected operations.
- Wrote technical reports and internal tutorials, and supported internal tool development with HTML and CSS layout work.
- Verified backup jobs and data integrity, and carried out defined corrective actions to protect business continuity.
- Monitored alerts from Cisco and HPE switches and Sophos firewalls and escalated them to the network and security teams.

## PROJECTS

**SmartCity Bogotá — Urban data platform with an AI agent**
*University capstone · team of 3 · 2026 · private repository, demo on request*
**Stack:** Java 17 (Jakarta Servlets), MySQL, JavaScript, Python, Groq API, Three.js, Docker, Azure, Power BI

- Web platform that brings together Bogotá open data on safety, mobility and air quality; includes an AI agent with function calling and voice input (Whisper) that answers with server-side data.
- Built the data ingestion (Python ETL) and MapReduce-style processing of 1.5M+ crime records (SIEDCO 2020–2026), with export to Power BI.
- Implemented security: PBKDF2-HMAC-SHA256 password hashing, TOTP two-factor authentication (RFC 6238), role-based access control and login lockout.
- Built the responsive frontend without frameworks (HTML, CSS, JavaScript), the canvas 2D intro animation and the 3D browser game “Ilumina Bogotá”.

**SOC Forense — AI-assisted security log analysis**
*University project · team of 4, developed most of the application · github.com/ValenJV/soc-forense*
**Stack:** Java 17 (Servlets/JSP), MySQL, HikariCP, bcrypt, local LLM via OpenAI-compatible API (LM Studio)

- Integrated a local language model that analyzes evidence and drafts incident response plans; the app keeps working on rules alone if the model is unavailable.
- Detects attacks such as brute force with a custom rule engine mapped to MITRE ATT&CK, plus a severity-weighted risk index.

## EDUCATION

**B.Sc. Systems Engineering (8th semester) — Universidad de San Buenaventura, Bogotá** Feb 2023 – Nov 2027 (expected)
**Coding and Programming Diploma — Pontificia Universidad Javeriana** Sep 2020 – Mar 2021
